

FLEXIBLE COUPLINGS - RIGID COUPLINGS

Up to 130.000 Nm of torque and 205 mm bores

(BACKLASH FREE)

ComInTec[®]
Technology for Safety

FLEXIBLE COUPLINGS - RIGID COUPLINGS (BACKLASH FREE): introduction

The aim of the flexible coupling is to transfer motion between two shafts on the same axis whilst accounting for possible misalignments. We have various styles of flexible couplings suitable for a wide range of applications. The quality of the materials used, the careful design and the precision in manufacturing ensure long lasting high performance, safety and reliability for even the most complex applications.

Strengths of our Models:

- Available in fully turned steel, aluminium or stainless steel.
- Good reliability.
- Different customization possibilities.
- Wide selection.
- Highly accurate manufacturing.
- Optimum protection against environmental conditions.
- Competitive pricing without sacrificing quality.
- "Made in Italy" with certified quality.

Our main product ranges:

- "RIGID COUPLINGS (BACKLASH FREE)": for connections when high precision and high transmission torques are required.
- "ELASTOMERIC COUPLINGS": for connection between misaligned shafts with the need to absorb vibrations.

DISC COUPLING "GTR"

Torsionally rigid disc coupling with angular backlash free transfer of motion. Transmission and maximum flexibility in operation.

Available with personalized spacer.

Max torque 130.000 Nm - Max bore \varnothing 205 mm. 1

RIGID COUPLING "GRI"

Rigid coupling, in steel, suitable for shaft connections with good alignment. Available in one or two sections.

Max torque 860 Nm - Max bore \varnothing 50 mm. 17

BELLOW COUPLING "GSF"

Bellow coupling in aluminium with high torsional rigidity. Backlash free, low inertia and high reliability.

Max torque 300 Nm - Max bore \varnothing 45 mm. 21

BACKLASH FREE JAW COUPLING "GAS/SG"

Backlash free jaw coupling. Available with a range of hub connections, elastomeric elements with varied hardnesses and personalized spacer.

Max torque 2.080 Nm - Max bore \varnothing 80 mm. 25

JAW COUPLING "GAS"

Elastomeric jaw coupling, good vibration dampening properties. Available with different types of elastomeric element.

Max torque 9.600 Nm - Max bore \varnothing 130 mm. 30

COMPACT ELASTIC COUPLING "GEC"

Compact elastic coupling, protected from environmental conditions. Fast maintenance possible without the need to move the shafts.

Max torque 35.000 Nm - Max bore \varnothing 180 mm. 39

GEAR COUPLING "GD"

Gear coupling without wear due to the polyamide sleeve, suitable for high axial misalignments.

Max torque 5.000 Nm - Max bore \varnothing 125 mm. 43

FLEXIBLE COUPLING "GF"

Flexible coupling with compact dimensions, suited for applications where high shaft misalignments are present. Maintenance without the need to move the shafts.

Max torque 5.100 Nm - Max bore \varnothing 85 mm. 47

CHAIN COUPLING "GC"

Chain coupling, simple, economic and easy to assemble. Suitable for dry and dusty environments.

Max torque 8.000 Nm - Max bore \varnothing 110 mm. 49

FLEXIBLE COUPLINGS - RIGID COUPLINGS (BACKLASH FREE): hub connection types

Type A Plain bored H7 hub with set screw.

An economic and quick solution for low torque.

Type A1 H7 bore with keyway and set screw.

Standard solution on the hubs shown in the catalogue for horizontal assembling.

Type A2 Splined bore with set screw.

Recommended solution in the case of hard transmission.

Type B Single split clamp hub with plain H7 bore.

Reduction of angular backlash without change to the overall dimensions.

Type B1 Single split clamp hub with H7 bore and keyway.

Reduction of angular backlash, during reversing drives, and high torques.

Type B2 Single split clamp hub with splined bore.

Reduction of angular backlash in the case of hard transmission.

Type C Two piece clamp hub with plain H7 bore.

Reduction of angular backlash, and simple radial assembly/disassembly.

Type C1 Two piece clamp hub with H7 bore and keyway.

Simply assembly and reduction angular backlash, even on high torque.

Type G Clamp connection with internal Taper Bush.

Flexibility of fitting for conical bushing without angular backlash.

Type D Clamp connection with integrated locking assembly.

suitable for high speeds without change to standard dimensions (.../CCE version).

Type E Clamp connection with internal locking assembly.

Reduction of angular backlash and reduced radial dimensions.

Type F Clamp connection with external locking assembly.

Fast and economic solution to transmit low torque.

Bore and Keyways according to UNI 6604 (DIN 6885-1)

GUIDE TO CHOOSING

For correct dimensioning of the chosen coupling, it is necessary to determine the correct torque to be transmitted, taking into consideration the type of application and determining the service factor "f". In the table below, this value is indicated referring to some common applications according to normative Agma 514.02.

The generic formula for calculating the value of the rated torque must ensure that the coupling is as follows:

$$C_{nom} \geq \frac{9550 \cdot f \cdot P}{n}$$

➔

Where:

- C_{nom} = coupling's nominal torque [Nm]
- f = service factor
- n = speed [Rpm]
- P = power applied [Kw]

Sector	Type of machines	Service factor			
		Combustion engines		Electric motors Gas / Vapor turbine	Water turbine
		1÷3 Cylinders	4÷12 Cylinders

TORSIONALLY RIGID COUPLING

Up to 130.000 Nm of torque and 205 mm bore

GTR

ComInTec[®]
Technology for Safety

GTR - torsionally rigid coupling: introduction

- Made in steel fully turned with standard treatment of phosphating.
- Disc pack in stainless steel.
- High torsional rigidity.
- Maintenance and wear free.
- Version with double disc pack: GTR/D.
- High torque possible.

ON REQUEST

- Use in applications with high operation temperatures (> 150 °C) possible.
- Specific treatments or version in full stainless steel possible.
- Reinforced couplings for specific requirements and heavy applications.
- Connection to torque limiter (safety coupling) range possible.

Designed to suit applications where high reliability, precision and an optimum weight/power ratio is required; ideally suited for applications with high speeds and power, also offering low overhung loads when using the spacer version.

This coupling is composed of three main items: the two fully turned hubs, made in steel UNI EN10083/98 and the disc pack, in stainless steel AISI 304 C with connection screws in steel class 10.9. In the "double" version, GTR/D, there is also a spacer made to length, also built in steel UNI EN10083/98, fixed between the hubs and the two disc packs.

All the components of GTR couplings, except the spacer (GTR/D and GTR/DBSE) are made and statically balanced in class DIN ISO 1940-1:2003 Q 6.3, before the machining of the keyway.

In accordance to the specific need of the application, it is possible to make static or dynamic balancing on each separate component or on the coupling, fully assembled to customer requirements.

DESCRIPTION OF DISCS

The fundamental elements of this torsionally rigid coupling are the disc packs, built from a series of stainless steel discs type AISI 304-C, connected by steel bushes. This disc pack is connected in an alternate way to the hub flange or the eventual spacer, by using screws in steel class 10.9 and the relevant self-locking nuts.

With reference to the configuration, the disc packs can be:

- Continuous ring disc pack for 6 screws (coupling sizes 1-7)
- Sectional disc pack for 6 screws (coupling sizes 8-11)
- Sectional disc pack for 8 screws (coupling sizes 12-15)

Assembly example with internal and external locking bushes.

GTR - torsionally rigid coupling: introduction

MANUFACTURING

Version with personalized spacer for a specific D.B.S.E. (page 12).

Manufacturing with internal hubs in order to reduce the axial dimensions.

Manufacturing in addition to the /SG torque limiters range, with simple and/or double disc pack.

Solution with adaptors both in simple and double version, for easy substitution of disc packs without moving the hubs (in accordance with directive API610).

Solution for vertical mounting, where the spacer (GTR/D or gtr/dbse) has to be supported to avoid the weight by pre-loading the disc pack.

GTR/DBSE - torsionally rigid coupling with spacer: introduction

- Made in steel and fully turned.
- Galvanizing corrosion proofing.
- Disk pack in stainless steel.
- Maintenance and wear free.
- Personalized spacer version for a specific D.B.SE.
- Welded spacer for high torsional rigidity.

ON REQUEST

- Use in applications with high operation temperatures ($> 150\text{ }^{\circ}\text{C}$) possible.
- Dynamic balancing up to $Q=2,5$ possible.
- Customized versions for specific needs.
- Different hub connection type possible (pages 4 and 5).

This backlash free coupling with spacer, called the GTR/DBSE (Distance Between Shaft Ends), consists of a central spacer that is made to order depending on the application and two flexible disc packs and hubs allowing for the connection of two driver shafts located apart. This type of disc coupling is made of special steel with the disc packs manufactured in AISI 304 stainless steel, in order to obtain a wear and maintenance free flexible coupling. To promote a long life even in adverse conditions the coupling is supplied with an anti-corrosive surface treatment. All the parts of the coupling (with exception of the DBSE spacer version) are statically balanced in class DIN-ISO 1940:1:2003 Q 6.3 before machining of the key and its locking screw.

In accordance with the specific requirements of the application, you can perform a static or dynamic balancing different on each separate component or the coupling fully assembled.

DESCRIPTION OF DISCS

The fundamental elements of this torsionally rigid coupling are the disc packs, built from a series of stainless steel discs type AISI 304-C, connected by steel bushes. This disc pack is connected in an alternate way to the hub flange or the eventual spacer, by using screws in steel class 10.9 and the relevant self-locking nuts.

With reference to the configuration, the disc packs can be:

- Continuous ring disc pack for 6 screws (coupling sizes 1-7)
- Sectional disc pack for 6 screws (coupling sizes 8-11)
- Sectional disc pack for 8 screws (coupling sizes 12-15)

APPLICATION EXAMPLE

Connecting two driving units situated some distance apart.

In the case of $DBSE > 3\text{ m}$ with high speed, it is necessary to use an intermediate shaft with support and bearing

- Choice and availability of different hub connection type see pages 4 and 5.

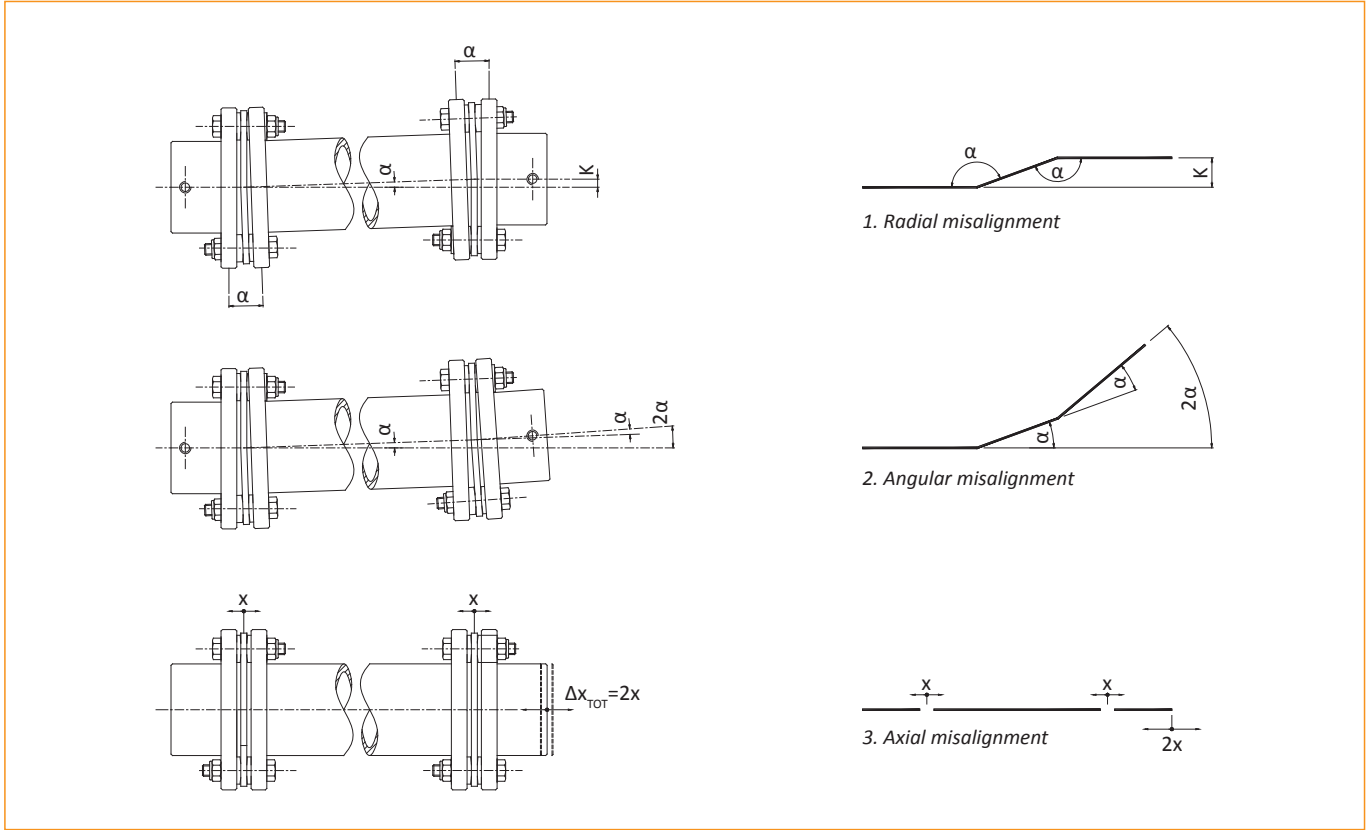

GTR/DBSE - torsionally rigid coupling with spacer: additional information

The model with spacer "GTR/DBSE", in addition to being essential for connecting elements of transmissions situated apart, it is able (unlike the classic model GTR/S) to recover, as needed, up to twice the angular misalignment (figure 2) and axial (figure 3) or a high radial misalignment (figure 1) according to the formula:

$$K = [L_{tot} - (2 \cdot N) - P] \cdot \text{Tg } \alpha$$

Where:

- K = Radial misalignment [mm]
- L_{tot} = Total length GTR/DBSE coupling [mm]
- N = Useful length of an half-hub [mm]
- P = Useful part of elastic element [mm]
- α = Angular misalignment GTR/S [°]

It is also possible to determine the positioning error through the torsion angle according to the formula:

$$\beta = \frac{180 \cdot C_{mot}}{\pi \cdot R_{TOT}}$$

Where:

- β = Torsion angle [°]
- C_{mot} = Max torque motor side [Nm]
- R_{TOT} = Total torsional rigidity of coupling [Nm/rad]

The total torsional rigidity of the GTR/DBSE coupling is expressed by the formula:

$$R_{TOT} = \frac{1}{\left(\frac{2}{R_{rS}} + \frac{1}{R_{rrel}}\right) \cdot L_t}$$

Dove:

- R_{TOT} = Total torsional rigidity of coupling GTR/DBSE [Nm/rad]
- R_{rS} = Torsional rigidity of coupling GTR/S [Nm/rad]
- R_{rrel} = Relative rigidity of spacer [Nm/rad]
- L_t = Spacer length (=DBSE-2P) [m]

The maximum speed of the coupling is influenced by several factors:

- Peripheral speed of the coupling;
- Weight of the coupling;
- Length of the spacer;
- Rigidity of the coupling;
- Quality of balance.

In general, for most applications that require the GTR/DBSE model, dynamic balancing is NOT required. In other cases there need to evaluate in reference to the graphic 4 in function of the speed and the length of the extension custom.

4. Balancing ratio in function of DBSE (GTR/DBSE)

For pre-selection of the coupling's size you can use the generic formula indicated on page 6. The GTR coupling will accommodate momentary peak torque "C.C." of 2,5 times than nominal torque. If the C.C. is higher than 2,5 times than the nominal torque, it is necessary to choose the coupling using the following formula:

$$C'_{nom} = \frac{C.C.}{2,5}$$

➔

Where:

C'_{nom} = theoretic nominal torque of the coupling [Nm]

C_{nom} = effective nominal torque of the coupling [Nm]

C.C. = peak torque [Nm]

$$C_{nom} \geq C'_{nom}$$

➔

The nominal torque indicated on the catalogue for GTR coupling refers to the static torque 2 times lower than the nominal torque, with service factor f=1.5. On the contrary, if the static torque of the motor is two times higher than the nominal one, it is possible using the following formula:

$$C_{nom} = \frac{C_{spunto}}{1,5}$$

➔

Where:

C'_{nom} = theoretic nominal torque of the coupling [Nm]

C_{nom} = effective nominal torque of the coupling [Nm]

C_{spunto} = peak torque [Nm]

$$C_{nom} \geq C'_{nom}$$

➔

Having calculated the theoretical nominal torque (C'nom), so that the coupling can be sized correctly it is necessary, to compare the effective technical characteristics of GTR (pages 8-9) and to choose the size able to transmit an effective nominal torque (Cnom) higher or equal to the one found by the described formulae above.

Having established the size of the coupling to be used, it is possible to make other checks considering further parameters:

$$C_{nom} > \frac{9550 \cdot P}{n} \cdot f \cdot f_T \cdot f_D$$

➔

Dove:

C_{nom} = nominal torque of the coupling [Nm]

f = service factor (pag.5)

f_T = thermic factor (grafico 1)

f_D = direction factor

f_k = load factor

n = speed [Rpm]

P = applied power [Kw]

$$C_{nom} > \frac{9550 \cdot P}{n} \cdot f_k \cdot f_T \cdot f_D$$

➔

Direction factor (f_D)

1 = one-direction rotation

2 = alternate rotation

Load factor (K)

1,5 = continuous load

2 = discontinuous load

1,5÷2 = machine tool

2,5÷4 = shock load

1. Thermic factor (f_T) in function of the operating temperature [°C]

Once the torque to be transmitted has been calculated and verified, it is necessary to consider flexibility offered by the chosen coupling with actual misalignments present between the shafts to be connected.

It is important to note that the axial and radial misalignments permitted are inversely proportional (where one increases the other must decrease). If all types of misalignment are present in the assembly it is important the total sum as a percentage to not exceed 100% as shown in graphic 2.

GTR & GTR/DBSE - torsionally rigid coupling: additional information

The rated outputs on the catalogue refer to normal use without shocks and with shafts well-aligned with the environmental temperature. The value of axial thrust (+ 20%) is relevant to the axial movement (graphic 7).

The maximum speed of the coupling is influenced by several factors:

- Peripheral speed of the coupling;
- Weight of the coupling;
- Length of the spacer (pages 12-14);
- Rigidity of the coupling;
- Quality of balance.

In general, for most applications dynamic balancing is NOT required; in other cases there is need to evaluate in reference to the graphic 8.

FITTING

- 1) Achieve radial and axial alignment as precisely as possible to permit the maximum absorption of possible misalignments and life of the coupling (picture 5 and 6).
- 2) Make sure that the shafts are assembled so that its extremity is square with the surface of the half-coupling (the length of the spacer including two disc packs should be equal to the distance between the two shafts) (picture 9).
- 3) Tightening the screws with a torque wrench in a cross sequence, continuously until you obtain the tightening torque indicated in the catalogue. It is recommended that only the nut/bolt not in contact with the disk pack is rotated to prevent twisting of the laminations.
- 4) Finally it is necessary to check and ensure the disc packs are perfectly perpendicular to the shaft axis. It may be necessary to release and tighten some screws again.

In the coupling with spacer (GTR/D and GTR/DBSE), the central part of the couplings (spacing bar) can be considered as a weight suspended between two springs (lamellar pack). It will have a natural frequency which, if excited, can produce some oscillations of the spacer causing damage to packs. It is recommended to increase the distance between the flanges of the hubs compared to the nominal dimensions "DBSE" (picture 9) by 1,5-2 mm to decrease the natural axial frequency. In this way the lamellar packs are kept under tension and the possibility of spacer oscillation reduces.

Note: about installation in vertical position please see execution proposal at page 9.

Up to 860 Nm of torque and 50 mm bore

GRI

ComIntec[®]
Technology for Safety

GRI - rigid coupling: introduction

- ⊙ Made in steel fully turned with phosphating treatment.
- ⊙ Extremely rigid connection.
- ⊙ High torque possible.
- ⊙ Wear and maintenance free.
- ⊙ Compact dimensions.
- ⊙ Finished bore with ISO H8 tolerance and low roughness.

ON REQUEST

- ⊙ Different customized bore.
- ⊙ Single split clamp hub with keyway (type B1).
- ⊙ Two piece clamp hub with keyway (type C1) or without keyway (type C).
- ⊙ Anti-corrosive surface treatments for specific needs possible.

GRI rigid couplings have been designed and manufactured to connect two shafts of the same diameter but without allowing any relevant misalignment.

The coupling is manufactured in one element for the single split version. A two piece unit is available on request allowing simple and fast mounting and dismounting.

■ DIMENSIONING

The nominal torque of the coupling must be higher than the maximum torque of the motor's side, according to the generic formula on page 6. The indicated torque values have been calculated based on a friction coefficient for shaft-coupling of $0.15 \mu\text{m}$.

■ FITTING

It is advised to machine the connecting shafts with:

- Surface finish with $R_a=1.6 \mu\text{m}$.
- Nominal tolerance h6.
- Perfectly aligned shafts.

Tighten the locking screws in steel class 8.8 with a torque wrench, in accordance to the tightening torque indicated in the catalogue.

■ APPLICATION EXAMPLE

Locking type B

Locking type C

BELLOW COUPLING

Up to 300 Nm of torque and 45 mm bore

GSF

ComInTec[®]
Technology for Safety

GSF - bellow coupling: introduction

- ⦿ Hubs made in aluminum fully turned and bellow in stainless steel.
- ⦿ Suitable for applications with high temperatures (> 300 °C).
- ⦿ High torsional rigidity and low inertia.
- ⦿ Wear and maintenance free.
- ⦿ Backlash free for precision and high speeds.
- ⦿ Single split clamp hub (type B) and finished bore in ISO H8 tolerance and low roughness.

ON REQUEST

- ⦿ Single split clamp hub with H7 bore and keyway (type B1).
- ⦿ Two piece clamp hub with H7 bore and keyway (type C1) or without keyway (type C).
- ⦿ Customized manufacturing for specific requirements.
- ⦿ Connection to the Torque limiter's (safety coupling) range possible.

The GSF bellow couplings have been designed and manufactured for all applications requiring excellent dynamic characteristics, necessary for high speeds, fast reversing and, at the same time, torsional rigidity with low inertia without compromising the high reliability.

The coupling is made in three different and modular elements, in order to obtain high flexibility in assembling and availability. The two shafts are connected to the bellow exploiting a simple mechanic system, easy and safe, by properly sized radial screws and without using bonding agents. In this way the coupling is able to operate and withstand high temperatures, up to 300 °C.

The coupling allows the compensation of all possible misalignments between the two shafts, to be connected in accordance to the values indicated in the table, assuring an infinite number of working cycles.

DIMENSIONING

The coupling's nominal torque must be higher than the maximum torque of the motor shaft, according to the generic formula on page 5. For further checks it is useful to verify: inertia on acceleration / deceleration, incorrect positioning in case of application when high precision is required, the natural frequency of the application (simplified system with two masses) according to formulas:

$$C_{nom} = C_{ad} \cdot K \cdot \frac{J_{uti}}{J_{mot} + J_{uti}}$$

$$\beta = \frac{180 \cdot C_{mot}}{\pi \cdot R_t}$$

$$F_e = \frac{1}{\pi} \sqrt{R_t \cdot \frac{J_{uti} + J_{mot}}{J_{uti} \cdot J_{mot}}} > 2 \cdot f_{mot}$$

Where:

C_{nom} = nominal torque of the coupling [Nm]
 C_{ad} = max value between acceleration torque on the motor side and deceleration torque on the user side [Nm]
 C_{mot} = maximum torque on the motor side [Nm]
 F_e = system frequency with two masses [Hz]
 f_{mot} = frequency on the motor side [Hz]
 J_{mot} = inertia on the motor side [Kgm²]
 J_{uti} = inertia on the user side [Kgm²]
 K = load factor
 R_t = torsional rigidity of the coupling [Nm/rad]
 β = rotation angle [°]

Load factor (K)

1,5 = continuous load
 2 = discontinuous load
 2÷3 = machine tools
 2,5÷4 = shock load

Simplified system with two masses.

FITTING

It is advised to machine the connection's shafts with:

- Surface finish with Ra=1.6 µm.
- Coaxial precision 0.01 mm.
- Nominal tolerance h6.

At first, assemble the coupling by inserting the bellow into the relevant hubs and tighten the screws "S2" in sequence, respecting a cross sequence, continuously until you obtain the tightening torque indicated in the catalogue. Insert one hub on the first shaft along the N length and tighten the clamp locking screw "S1" with a torque wrench, respecting the tightening torque indicated on the catalogue. Leave the second shaft slides on the opposite hub along the whole N length and tighten the clamp locking screw with a torque wrench, respecting the tightening torque indicated on the catalogue.

It is important to consider that misalignments, axial, angular and parallel, must be considered paired together, as inversely proportional (one reduces when the other increases). If all types of misalignments occur, it is necessary that the sum in percentage respect to the maximum value doesn't exceed 100%. If the metallic bellow is damaged, the whole coupling becomes unusable, so it is advised to be very careful in assembling and disassembling the individual components.

GAS/SG GAS

ComInTec[®]
Technology for Safety

GAS/SG-ST - backlash free jaw coupling «in steel»: introduction

- Made in steel fully turned with standard phosphating treatment.
- Several elastomer hardnesses available (page 27).
- High torsional rigidity.
- Electric insulation between the parts.
- Statically balanced.
- Version with integrated locking assemblies (GAS/SG/CCE page 29).

ON REQUEST

- Conformity to directive ATEX possible.
- Specific surface treatments or fully stainless steel version.
- Customized manufacturing for specific requirements.
- Connection to the Torque limiter's (safety coupling) range possible.

The coupling GAS/SG is an elastomeric coupling with compact dimensions composed of two hubs made in steel UNI EN10083/98, fully turned and one elastomeric element.

The hub's tooth profile is designed to allow the elastomeric element to work only by compression and not in shear, allowing for a longer life of the coupling in high reversal or load applications.

The presence of the elastomer assures:

- the possibility to absorb collisions and vibrations;
- to compensate for unavoidable misalignments between the shafts;
- silence during transmission.

The basic series of GAS/SG is composed of different details that can be assembled together in order to get the right configuration for the application:

- **Hub 1 (M1):** hub base for any type of connection
- **Long hub 1 (M1L):** extended hub for connecting long shafts
- **Hub 2 (M2):** hub with external diameter lowered for assembly in confined spaces

Hub M1

Hub M1L

Hub M2

DESCRIPTION OF THE ELASTOMERIC ELEMENT

The fundamental item of this coupling is the elastomeric element or elastomer, made in polyurethane and available in several hardness grades, for different uses and applications. The elastomer is manufactured to resist ageing, scoring, fatigue, hydrolysis and UV radiations, promoting longer life operation. It also resists main chemical agents, like ozone, oils, grease and hydrocarbons.

The elastomeric element becomes prestressed during the assembly between the relevant hub's teeth, in order to be able to transmit the motion without backlash, so torsionally rigid inside the prestressing load. The prestressed elastomer's surface is sufficiently wide to induce a low contact pressure on the tooth of the same elastomer, reducing permanent deformations and promoting a long life.

ATEX CONFORMITY

The GAS/SG coupling can be supplied in accordance to directive 94/9/CE ATEX, which is relevant to protection apparatus and systems for use in potentially explosive spaces.

The dimensions of this coupling's version are not different from the standard version.

A mark relevant to the coupling's performances is printed on the hubs. It is necessary to consider planned tests, like those in the use and maintenance manual supplied together with each ATEX coupling.

The elastomeric elements used can be:

- red elastic element in polyurethane, 98 Shore-A : II 2 G D c T6 -20≤Ta≤+60°C X U
- yellow elastic element in polyurethane, 92 Shore-A : II 2 G D c T5 -20≤Ta≤+80°C X U

GAS-ST - standard jaw coupling «in steel»: introduction

- Made in steel fully turned with standard phosphating treatment.
- Several elastomer hardnesses available (page 31).
- High compensation of misalignments.
- Vibration dampening.
- Statically balanced.
- Modularity of the components, with different assembly versions.

ON REQUEST

- Conformity to ATEX directive possible.
- Specific treatments or version fully in stainless steel.
- Manufacturing made to length and customizations for specific needs.
- Connection to the Torque limiter's (safety coupling) range possible.

The coupling GAS/SG is an elastomeric coupling with compact dimensions composed of two hubs made in steel UNI EN10083/98, fully turned with one elastomer.

The hub's tooth profile is designed to allow the elastomeric element to work only by compression and not in shear, allowing for long life of the coupling in high reversal or load applications.

The GAS base series are available in several hub versions to allow an assembly to suit the application.

- **Hub 1 (M1)** : base hub for any kind of connection.
- **Long hub 1 (M1L)** : extended hub to connect long shafts.
- **Hub 2 (M2)** : hub with reduced external diameter for assembly in compact spaces.
- **Flangie (F)** : flange for connection shaft-flange.

Hub M1

Hub M1L

Hub M2

Flangie F

DESCRIPTION OF THE ELASTOMERIC ELEMENT

The fundamental item of this coupling is the elastomeric element, made in different grades of hardness for different needs and applications. The elastomer is manufactured from elements to resist ageing, scoring, fatigue, hydrolysis and UV radiations, promoting long life operation and resisting main chemical agents, like ozone, oils, greases and hydrocarbons.

ATEX CONFORMITY

The GAS/SG coupling can be supplied in accordance to ATEX 94/9/CE directive, which is relevant to protection apparatus and systems for use in potentially explosive spaces.

The dimensions of this coupling's version are not different from the standard version.

A mark relevant to the coupling's performances is printed on the hubs. It is necessary to consider planned tests, as described in the use and maintenance manual supplied together with each ATEX coupling.

The elastomeric elements used can be:

- yellow elastic element in polyurethane, 92 Shore-A : II 2 G D c T5 -20≤Ta≤+80°C X U

NOTES

▲ On request

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.

GAS/SG-AL & GAS-AL - backlash free and standard jaw coupling «in aluminium»: technical data

- ⊙ Made in aluminum fully turned.
- ⊙ Elastomer available in different hardness (see pages 24 and 31).
- ⊙ Weight and inertia reduced.
- ⊙ Electrical insulation between the parties.
- ⊙ Statically balanced.
- ⊙ Modular components with different locking systems on the hubs.

ON REQUEST

- ⊙ Single split clamp hub with H7 bore and keyway (type B1).
- ⊙ Two piece clamp hub with H7 bore and keyway (type C1)
- ⊙ Conformity to Directive ATEX possible.
- ⊙ Customized manufacturing for specific requirements.

NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.

GAS/SG/DBSE-AL - backlash free jaw coupling with spacer «in aluminium»: technical data

- Made of aluminum fully turned.
- Elastomer available in different hardness (see pages 25 and 29).
- Simple mounting thanks to the two piece clamp hub (type C).
- Radial assembly without removing the parts.
- Electrical insulation between the parts.
- Spacer with DBSE custom made.

ON REQUEST

- Two piece clamp hub with keyway (C1).
- Various hub connection types available.
- Conformity to Directive ATEX possible.
- Dynamic balancing up to Q=2.5.

NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.

The model with a central spacer "GAS / SG / DBSE-AL", in addition to being essential for connecting transmission drives spaced apart. Is able (unlike the classic model GAS/SG) to recover, as needed, up to twice the angular misalignment (picture 2) and axial (picture 3) or a high radial misalignment (picture 1) according to the formula:

$$K = [L_{tot} - (2 \cdot N) - P] \cdot \text{Tg } \alpha$$

Where:

K = radial misalignment [mm]

L_{tot} = total length of GAS/DBSE coupling [mm]

N = useful length of an half-hub [mm]

P = useful space of the elastomeric element [mm]

α = angular misalignment [°]

It is possible to determine also the positioning error by the torsion angle according to the formula:

$$\beta = \frac{180 \cdot C_{mot}}{\pi \cdot R_{TOT}}$$

Where:

β = torsion angle [°]

C_{mot} = maximum torque motor side [Nm]

R_{TOT} = total torsional rigidity of the coupling [Nm/rad]

In case of GAS/SG/DBSE-AL the total torsional rigidity of the coupling is expressed by the formula:

$$R_{TOT} = \frac{1}{\left(\frac{2}{R_T} + \frac{L_i}{R_{rel}}\right)}$$

Where:

R_{TOT} = total torsional rigidity [Nm/rad]

R_T = torsional rigidity of spider [Nm/rad]

R_{rel} = torsional rigidity of spacer [Nm/rad]

L_i = spacer length (=DBSE-2Y) [m]

■ Only for GAS/SG-AL version (page 33)

NOTES ■

- For the choice of the coupling, is considered a safety factor of 1,5 on the nominal torque and an ambient temperature of 27 °C

GAS/SG & GAS - backlash free and standard jaw coupling: additional information

APPLICATION EXAMPLE

DIMENSIONING

For pre-selection of the coupling's size you can use the generic formula indicated on page 6.

Having established the coupling's size to be used, it is possible to make other checks considering further parameters:

$$C_{nom} > C_{mot} \cdot f_T \cdot f_R$$

Dove:

- C_{nom} = theoretic nominal torque of the coupling [Nm]
- C_{mot} = nominal torque motor side [Nm]
- C_{max} = maximum torque of the coupling [Nm]
- C_{SU} = static torque user side [Nm]
- C_{SM} = static torque motor side [Nm]
- f_A = starting frequency factor
- f_R = rigidity factor
- f_T = thermic factor
- J_{mot} = inertia motor side [Kgm²]
- J_{uti} = inertia user side [Kgm²]
- K = shock factor

$$C_{max} = C_{SM} \cdot \frac{J_{uti}}{J_{mot} + J_{uti}} \cdot K \cdot f_T \cdot f_A + C_{mot} \cdot f_T \cdot f_R$$

Dove:

- C_{alt} = alternate system torque [Nm]
- C_{nom} = theoretic nominal torque of the coupling [Nm]
- f_F = resonance factor
- f_R = rigidity factor
- f_T = thermic factor
- M = coefficient of material

$$C_{nom} = C_{SU} \cdot \frac{J_{uti}}{J_{mot} + J_{uti}} \cdot K \cdot f_T \cdot f_A + C_{mot} \cdot f_T \cdot f_R$$

Dove:

- C_{alt} = alternate system torque [Nm]
- C_{nom} = theoretic nominal torque of the coupling [Nm]
- f_F = resonance factor
- f_R = rigidity factor
- f_T = thermic factor
- M = coefficient of material

$$C_{nom} > \frac{1}{M} \cdot C_{alt} \cdot f_F \cdot f_T \cdot f_R$$

Dove:

- C_{alt} = alternate system torque [Nm]
- C_{nom} = theoretic nominal torque of the coupling [Nm]
- f_F = resonance factor
- f_R = rigidity factor
- f_T = thermic factor
- M = coefficient of material

Coefficient of material (M)
 0,25 = aluminium
 0,35 = steel

Resonance factor (f_F)
 1 = frequency < 10
 $\sqrt{f/10}$ = frequency > 10

Rigidity factor (f_R)
 2÷5 = positioning system
 3÷8 = tool machines
 >10 = turn indicator

Shock factor (K)
 1 = light shock
 1,4 = medium shock
 1,8 = hard shock

Thermic factor (f_T)
 1 = -30 ÷ +30 °C
 1,2 = +40 °C
 1,4 = +60 °C
 1,8 = +80 °C

Starting frequency factor (f_A)
 1 = 0 ÷ 100 starting each hour
 1,2 = > 100 ÷ 200 " "
 1,4 = > 200 ÷ 400 " "
 1,6 = > 400 ÷ 800 " "
 1,8 = > 800 ÷ 1600 " "

Completed and verified the choice of the coupling respect the torque to be transmitted, it is necessary to consider the flexibility, comparing the misalignment allowed by the type of coupling chosen with the real ones provided by the shafts to be connected. If simultaneously present at all types of misalignment, it is necessary that the sum as a percentage of the maximum value does not exceed 100%, according to the graphic 1.

GAS/SG & GAS - backlash free and standard jaw coupling: additional information

FITTING

This coupling does not require particular procedures for assembly. It can be assembled both vertically and horizontally.

- 1) Achieve radial and axial alignments as precisely as possible, in order to have maximum absorption of possible misalignments and life of the coupling.
- 2) Assemble the two half-hubs on the shafts. Check that the external parts of the two shafts do not exceed the relevant half-hub's surface (quote "N") and fix this one to the shaft with its relevant fixing system.
- 3) Assemble the elastomeric element on one half-hub and close the other inserting the relevant teeth into the elastomeric element, being careful to respect the distance of the two half-hubs indicated on the catalogue, quote "P".

In case of connection by clamp locking or locking assemblies, tighten the relevant screws progressively up to the tightening torque indicated in the catalogue, using a cross sequence.

COMPACT ELASTIC COUPLING

Up to 35.000 Nm of torque and 180 mm bore

GEC

ComInTec[®]
Technology for Safety

GEC - compact elastic coupling: introduction

- Made in steel fully turned with standard treatment of phosphating.
 - Maintenance without removing the coupling
 - Suitable for working in high temperatures.
 - Statically balanced, suitable to absorb vibrations.
 - Highest protection.
 - Excellent value torque/dimensions.
- ON REQUEST
- Various hub connection type available.
 - Specific treatments or aluminum version fully turned available.
 - Customized versions for specific needs including hub/flange connection.
 - Connection to the Torque limiter's (safety coupling) range possible.

The GEC coupling is composed of two hubs in steel UNI EN10083/98 fully turned. These two hubs are connected by radial pins, made in steel with high resistance and seated within the elastomeric elements. These pins, with their relevant elastomeric elements, are protected by an external band, allowing the coupling a high grade of protection. This construction feature allows the user to be able to perform maintenance, by substituting the elastic elements, without the need to move the two transmission hubs/shafts, reducing maintenance times and optimizing the plant productivity. Particularly suitable for connecting Pelton turbines, for the coupling between engines and worm compressors and in general for transmission where safety is highly necessary without compromising the quality and effectiveness of the same transmission.

DESCRIPTION OF THE ELASTOMERIC ELEMENT

- The main features that distinguish this elastic element are as follows:
- Good resistance to all common lubricants and hydraulic fluids.
 - Optimum mechanical properties.
 - Green element suitable to operate for short periods up to 170 °C.

DIMENSIONING

For pre-selection of the coupling's size you can use the generic formula indicated on page 6. Alternatively it is possible to determine the coupling's nominal torque using several correction factors:

$$C_{nom} > C_{mot} \cdot f \cdot K \cdot f_T \cdot f_A$$

Where:

- C_{nom} = theoretic nominal torque of the coupling [Nm]
- C_{mot} = nominal torque motor side [Nm]
- f = service factor (see page 5)
- f_A = starting frequency factor [Hz]
- f_T = thermic factor
- K = shock factor

Shock factor (K)	
1,2	= light shock
1,5	= medium shock
1,8	= hard shock

Thermic factor (f_T)	
1	= -36 ÷ +60 °C
1,2	= 80 °C
1,4	= 100 °C
1,8	= 120 °C

Starting frequency factor (f_A)	
1	= 0 ÷ 120 starting each hour
1,2	= 240 starting each hour
1,4	= 400 starting each hour
1,6	= 800 starting each hour
1,8	= 1600 starting each hour

Having completed and checked the coupling's choice, in accordance to the torque to be transmitted, it is necessary now, to take into consideration, the necessary flexibility comparing the misalignments allowed from the kind of coupling selected, with the real ones, seen by the shafts to be connected. It is important to consider that misalignments, axial, angular and parallel, must be considered paired together, as inversely proportional (one reduces when the other increases). If all types of misalignments occur, it is necessary that the sum in percentage respect to the maximum value doesn't exceed 100%.

FITTING

Specific procedures to assemble this coupling are not required.

- 1) Achieve radial and axial alignment as precisely as possible for maximum absorption of possible misalignments and the long life of the coupling.
- 2) Having pre-assembled the coupling, insert the external half-hub on one shaft. Check that the external parts of the two shafts don't exceed the relevant half-hub's surface (quote "N") and fix this one to the shaft with its relevant fixing system.
- 3) Close the second shaft inserting it into the internal half-hub for a quantity not higher than the length of the bore (quote "N"). If the insertion should be difficult, due to an accentuated misalignment, it is advisable to release all the connection pins, this will allow for a higher flexibility between the two half-hubs.
- 4) After having inserted and fixed the hubs, take away each connection pin, damp them with loctite threadlocker, and reassemble and tighten them carefully in progressive way following a cross sequence.
- 5) Cover the pins with the protection band, making the holes of the band coincide with the relevant locking spheres.

NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- Choice and availability of different hub connection type see pages 4 and 5.

GEAR COUPLING

Up to 5000 Nm of torque and 125 mm bore

GD

ComInTec[®]
Technology for Safety

GD - gear coupling: introduction

- Hubs made in steel fully turned with standard treatment of phosphating.
- Polyamide sleeve.
- Statically balanced.
- Maintenance and lubrication free.
- Compact and simple to be assembled.
- Vibrations dampening.

ON REQUEST

- Various hub connection type available.
- Version with sleeve in steel, circlip and seals.
- Version with sleeve directly integrated in one hub.
- Specific surface treatments possible.

The GD coupling is composed of two hubs in steel UNI EN 10083/98 fully turned, externally toothed with rounded profile and assembled only with a sleeve in polyamide stabilized resin, toothed internally.

Due to the tooth profile with which the hubs and the sleeve are connected, you can obtain a high contact surface also in presence of misalignments, in order to reduce the contact pressures and promote a longer life.

The connection polyamide/steel assures silent and reliable functioning, in absence of maintenance and lubrication.

This kind of coupling represents a reliable and economic kind of connection, for medium and big power industrial purposes.

DESCRIPTION OF THE SLEEVE

The standard sleeve is made in polyamide 6.6 stabilized resin and its properties are as follows:

- Resistant to all common lubricants and hydraulic fluids
- Suitable to operate in a continuous way on temperatures from -25°C up to 90°C and for short periods up to 125°C
- Optimum sliding properties
- High insulating capacities
- Optimum mechanical properties

DIMENSIONING

For pre-selection of the coupling's size you can use the generic formula indicated on page 6.

Having established the coupling's size to be used, it is possible to make other checks considering further parameters:

$$C_{nom} > C_{mot} \cdot f_T \cdot f_R$$

Considerando la coppia di spunto:

$$C_{nom} = C_{SM} \cdot \frac{J_{uti}}{J_{mot} + J_{uti}} \cdot K \cdot f_T \cdot f_A + C_{mot} \cdot f_T \cdot f_R$$

$$C_{nom} = C_{SU} \cdot \frac{J_{uti}}{J_{mot} + J_{uti}} \cdot K \cdot f_T \cdot f_A + C_{mot} \cdot f_T \cdot f_R$$

Where:

C_{nom} = nominal torque of the coupling [Nm]

C_{mot} = nominal torque motor side [Nm]

C_{max} = maximum torque of the coupling [Nm]

C_{SU} = starting torque motor side [Nm]

C_{SM} = starting torque motor side [Nm]

f_A = starting frequency factor

f_R = thermic factor

f_T = inertia motor side

J_{mot} = inertia motor side [Kgm²]

J_{uti} = inertia user side [Kgm²]

K = shock factor

thermic factor (f_T)

1 = -40 ÷ +60 °C

1,2 = +70 °C

1,4 = +80 °C

1,6 = +90 °C

Shock factor (K)

1 = light shock

1,5 = medium shock

1,8 = hard shock

Starting frequency factor (f_A)

1 = 0 ÷ 120 starting each hour

1,2 = 240 starting each hour

1,4 = 400 starting each hour

1,6 = 800 starting each hour

1,8 = 1600 starting each hour

It is important to consider that misalignments, axial, angular and parallel, must be considered paired together, as inversely proportional (one reduces when the other increases). If all types of misalignments occur then it is necessary that the sum in percentage respect to the maximum value doesn't exceed 100%.

FITTING

Specific procedures to assemble this coupling are not required.

- 1) Achieve radial and axial alignment as precisely as possible to have the maximum absorption of possible misalignments and longer life of the coupling.
- 2) Having pre-assembled the coupling, insert the external half-hub on one shaft. Check that the external parts of the two shafts don't exceed the relevant half-hub's surface (quote "N") and fix this one to the shaft with its relevant fixing system.
- 3) Insert the sleeve on the two half-hubs being careful to respect the distance of the same half-hubs, quote "P" on the catalogue.
- 4) Before starting transmission be sure that the sleeve can move freely.

NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.

GD - gear coupling: additional information

ORDER EXAMPLE

GEAR COUPLING						
Model	Size	Version	Bore 1	Locking type bore 1	Bore 2	Locking type bore 2
GD	size 8	M1 - M1	bore \varnothing 40 H7	A1	bore \varnothing 40 H7	A1

Model	Size	Version	Locking type
GD gear coupling	From 1 to 13	M1 - M1 M1 - M1L	see hub connection type list at page 4
		M1L - M1 M1L - M1L	

FLEXIBLE COUPLING

Up to 5.100 Nm of torque and 85 mm bore

GF

ComInTec[®]
Technology for Safety

GF - flexible coupling: technical data

- Made in steel fully turned with standard treatment of phosphating.
- Simple manufacturing.
- High angular misalignments possible.
- Elastic element with an internal nylon weave for high reliability.
- Possible to maintain without the need to move the hubs.
- Finished bore (in ISO H7 tolerance) with keyway (in ISO H9 tolerance), and low roughness.

ON REQUEST

- Various hub connection type available.
- Specific surface treatments.
- Customized versions for specific needs.
- Connection to the Torque limiter's (safety coupling) range possible.

The GF coupling, even if being built simply, assures a high elastic reliability which allows the recovery of high angular misalignments (up to 5°), absolutely reducing the drive irregularities.

It is composed of two hubs in steel UNI EN10083/98 fully turned and by an elastomeric central ring connected with screws and bolts in alternate way in respect to the two hubs.

For pre-selection of the coupling's size you can use the generic formula indicated on page 6.

CHAIN COUPLING

Up to 8.000 Nm of torque and 110 mm bore

GC

ComInTec[®]
Technology for Safety

GC - chain coupling: technical data

- ⊙ Made in steel fully turned with standard treatment of phosphating.
- ⊙ Negligible power loss, absorbed by the coupling.
- ⊙ Simple manufacturing.
- ⊙ Hardening of hub teeth.
- ⊙ Optimum quality / price ratio.
- ⊙ Maintenance without moving the hubs axially.

ON REQUEST

- ⊙ Various hub connection type available on the hubs.
- ⊙ Specific surface treatments.
- ⊙ Customized versions for specific needs.
- ⊙ Connection to the Torque limiter's (safety coupling) range possible.

The chain coupling GC consists of two steel sprockets, machined and connected by a double chain. The manufacture of the coupling completely in steel allows to use at high temperatures and reduce the loss of power between the driving and driven.

LABEL

At ComInTec, as an element identifier for each group, we apply a sticker which shows all relevant information required for the traceability of the group and of the same production batch. This is necessary and indispensable to simplify the information needs of spare parts or the reordering of the same group. For some products, a plasticized green sticker is used with indelible ink, applied directly to the group. For other models it is a white adhesive label with thermal transfer ink applied on the packaging of the group.

MARKING

ComInTec® CERTIFICATION

- Certified company since february 1996 according to **UNI EN ISO 9001**.

- Internal and external environment protection complying with **directive 2002/95/CE (RoHS)**, that forbids the use of harmful substances during the production progress or in the end product, and complying with D.Lgs. 626/94 for security and health at work.

- Company and production completely **"Made in Italy"**.

- Maximum attention to market requests for **conformity with 94/9/CE (ATEX)** for use in potentially explosive environments.

- **ABS certification** to use in the naval sector.

- **European Power Transmission Distributors Association (EPTDA)**. The largest organisation of distributors and manufacturers of power transmission and motion control products in Europe.

- Continuous product research and development, some of them with **Italian and European patent**.

- **REACH (CE) conformity No.1970/2006**.

PROJECT REQUEST

Your needs are our priorities

If you need help with a project, ask for assistance or advice from the experts at ComInTec.

Simply fill out this form and send it by e-mail to tecnico@comintec.it. Your request will be met with the utmost speed.

 PLEASE DO SEND OR ATTACH A DRAWING OR PHOTOGRAPH WITH YOUR ENQUIRY AS THIS CAN HELP US TO BETTER UNDERSTAND YOUR APPLICATION.

ComInTec Srl reserves the right to discontinue the production of any model and/or to change specifications or designs at any time without notice and without incurring obligations.

The data given in this catalog are indicative and not binding. The torque values listed in the catalog refer to static testing performed in "normal" conditions.

These values can be subject to change, depending on the working parameters and environmental conditions.

This catalog cancels and replaces all previous ones.
